COMPUTER FUNDAMENTALS AND PROGRAMMING (BES 10a)

PORTFOLIO 2 CONDITIONALS

ARAÑA, JANELE A.
BSChE-1A
STUDENT

ENGR. VINCENT CALIMLIM
PROFESSOR

Introduction

Portfolio 2 is all about the use of conditionals, such as if, else, and elif; that is lesson 3 in Computer Fundamentals and Programming. For this portfolio, I chose a daily life scenario that can also be useful not just to me but also to the other students/persons that have the same problem in managing the budget in daily life. Such as in budgeting, if I can afford certain products for myself, especially since I am always scrolling and have a bad addiction to online shopping. I called this program, as “Daily Budget Audit”.

This program helps users to determine whether they can afford to buy a specific item by comparing their allocated budget with the price of the item. Moreover, this simple decision-making process is powered by the two-way decisions with else, an if-else structure.

Design of the Program

```
#Daily Budget Audit

[1]: budget=float(input("Enter the budget:"))
Enter the budget: 500

[3]: price=float(input("Enter item price:"))
Enter item price: 350

[27]: if price <=budget:
        print("You can afford this item.")
        print("Remaining balance of the budget:", budget-price)
    else:
        print("You cannot afford this item.")
        print("You need:", price-budget, "more")

You can afford this item.
Remaining balance of the budget: 150.0

[15]: print('Save money and Get what you want')

Save money and Get what you want

[ ]:
```

This design has a week's amount of savings and intends to make purchases with it. The item costs 350, and the budget is 500. The program automatically says that it can be afforded based on the budget and price of the item.

```
#Daily Budget Audit

[29]: budget=float(input("Enter the budget:"))
      Enter the budget: 100

[30]: price=float(input("Enter item price:"))
      Enter item price: 124

[31]: if price <=budget:
      print("You can afford this item.")
      print("Remaining balance of the budget:", budget-price)
      else:
      print("You cannot afford this item.")
      print("You need:", price-budget, "more")

      You cannot afford this item.
      You need: 24.0 more

[32]: print('Save money and Get what you want')
      Save money and Get what you want
```

This programmed data indicates that the budget is insufficient for the amount allotted; this situation occurs every day when someone wants McDonald's on a random day. The budget is 100 but the price of the item is 124, and the program have indicated sign that user cannot afford the item.

```
#Daily Budget Audit

[33]: budget=float(input("Enter the budget:"))
      Enter the budget: 100

[34]: price=float(input("Enter item price:"))
      Enter item price: 75

[35]: if price <=budget:
      print("You can afford this item.")
      print("Remaining balance of the budget:", budget-price)
      else:
      print("You cannot afford this item.")
      print("You need:", price-budget, "more")

      You can afford this item.
      Remaining balance of the budget: 25.0

[32]: print('Save money and Get what you want')
      Save money and Get what you want
```

On a daily basis, when someone eats at the canteen, this programmed data shows that the budget is adequate for the amount allocated. The program has indicated that the user can afford the meal, which costs 75 and has a budget of 100.
